Lecture 6 Stochastic Search

The problem statement

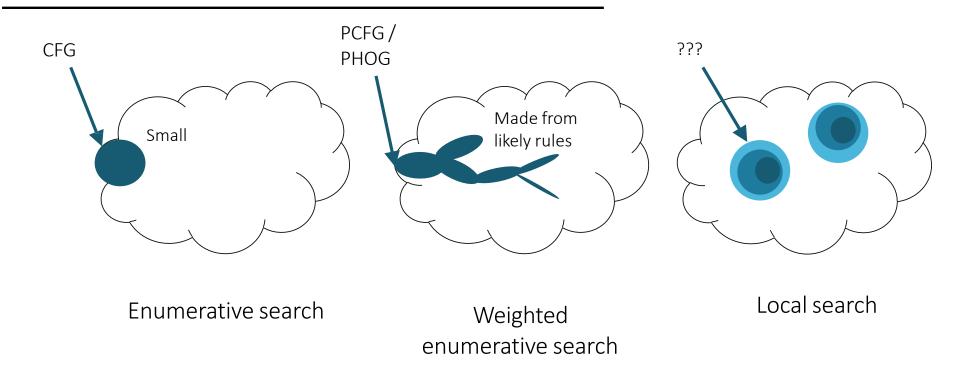

Stochastic search in synthesis

Weimer, Nguyen, Le Goues, Forrest. *Automatically Finding Patches Using Genetic Programming*. ICSE'09

Schkufza, Sharma, Aiken: *Stochastic superoptimization*. ASPLOS 2013

Shi, Steinhardt, Liang: FrAngel: Component-Based Synthesis with Control Structures. POPL'19

Search space

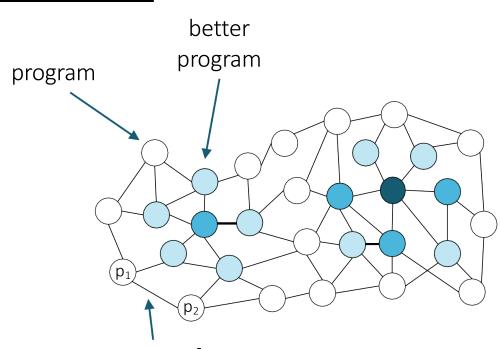

Naïve local search

To find the best program:

```
p := random()
while (true) {
   p' := mutate(p);
   if (cost(p') < cost(p))
      p := p';
}</pre>
```

Will never get to \bigcirc from $p_1!$

can generate p_2 from p_1 (and vice versa) via mutation

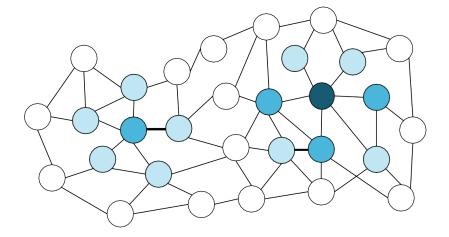

MCMC sampling

Avoid getting stuck in local minima:

```
p := random()
while (true) {
   p' := mutate(p);
   if (random(A(p -> p'))
      p := p';
}
```

where

- if p is better than $p: A(p \rightarrow p') = 1$
- otherswise: $A(p \rightarrow p')$ decreases with difference in cost between p' and p

MCMC sampling

Metropolis algorithm:

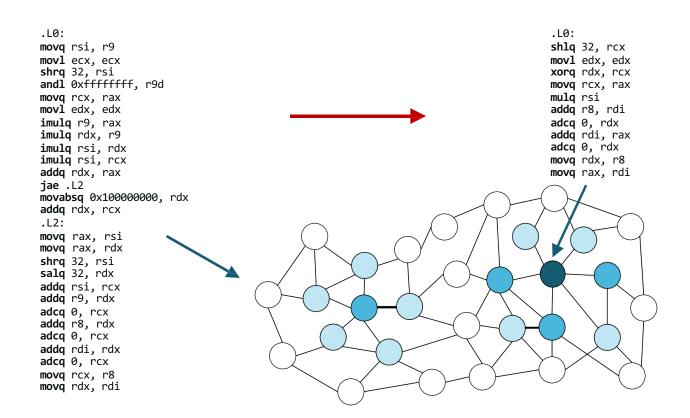

$$A(p \to p') = \min(1, e^{-\beta(C(p') - C(p))})$$

The theory of Markov chains tells us that in the limit we will be sampling with the probability proportional to

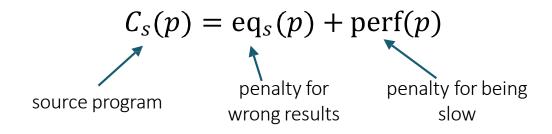

$$e^{-\beta * C(p)}$$

MCMC for superoptimization

[Schkufza, Sharma, Aiken '13]

Cost function

$$\operatorname{eq}_{s}(p) = \sigma_{t \in Tests} \operatorname{reg}_{s}(p, t) + \operatorname{mem}_{s}(p, t) + \operatorname{err}(p, t)$$

$$\uparrow \quad \qquad \uparrow \quad \qquad \downarrow \quad \qquad$$

when $eq_s(p) = 0$, use a symbolic validator

Cost function

$$\mathcal{C}_{\mathcal{S}}(p) = \operatorname{eq}_{\mathcal{S}}(p) + \operatorname{perf}(p)$$
source program

penalty for penalty for being wrong results slow

$$perf(p) = \sum_{i \in instr(p)} latency(i)$$

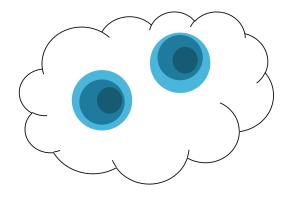

Local search: discussion

Strengths:

• can explore program spaces with no a-priori bias

Limitations?

• only applicable when there is a cost function that faithfully approximates correctness

Stochastic search in synthesis

Weimer, Nguyen, Le Goues, Forrest. *Automatically Finding Patches Using Genetic Programming*. ICSE'09

• Similar but for program repair, uses genetic programming

Schkufza, Sharma, Aiken: *Stochastic superoptimization*. ASPLOS 2013

Shi, Steinhardt, Liang: FrAngel: Component-Based Synthesis with Control Structures. POPL'19

- Samples from a grammar with bias towards partial solutions
- I assume they use stochastic just for ease of sampling
